Please amend the application as follows.

IN THE CLAIMS

1. (Amended) A method for treating a condition comprising orally administering a longitudinally compressed tablet core dosage form containing a drug in a pharmaceutically acceptable carrier wherein the dosage form releases the drug at an ascending release rate for an extended time period.

2. (Amended) A method for administering a drug to a subject comprising:

administering a dosage from to the subject wherein the dosage form comprises:

(a) a longitudinally compressed tablet core comprising a plurality of layers wherein the drug is contained in at least one layer and at least one other layer comprises a suitable fluid-expandable polymer;

(b) a semipermeable membrane surrounding the longitudinally compressed tablet core to thereby forming a compartment having an osmotic gradient to drive fluid from an external fluid environment contacting the semipermeable membrane into the compartment; and

(c) an orifice formed through the semipermeable membrane and into the longitudinally compressed tablet core to permit drug to be released from within the compartment into the external fluid environment;

wherein the dosage form releases the drug at an ascending release rate for extended time period.

3. (Amended) The method according to claim 2, wherein the longitudinally compressed tablet core comprises two layers and the drug is contained within a first

layer and the fluid-expandable polymer is contained within a second layer and the orifice is formed through the semipermeable membrane adjacent the first layer.

4. (Amended) The method according to claim 3, wherein the dosage form further comprises an outer surface having an immediate-release dose of a drug applied as a coating onto the outer surface of the dosage form.

5. (Amended) The method according to claim 2, wherein the longitudinally compressed tablet core comprises three layers and a portion of the drug is contained within a first layer and the remaining portion of the drug is contained within a second layer, wherein the portion of drug contained within the first layer is less than the portion of drug contained within the second layer, and wherein the fluid-expandable polymer is contained within a third layer and the orifice is formed through the semipermeable membrane adjacent the first layer.

6. (Amended) The method according to claim 5, wherein the dosage form further comprises an immediate-release dose of a drug applied as a coating onto the outer surface of the dosage form.

7. (Amended) A method for treating ADHD, the method comprising orally administering a longitudinally compressed tablet dosage form containing a CNS-acting drug in a pharmaceutically acceptable carrier wherein the dosage form releases the CNS-acting drug from the dosage form at an ascending release rate for an extended time period.

8. (Amended) The method according to claim 7, wherein the CNS-acting drug is a CNS-stimulant drug selected from the group consisting of methylphenidate, d-threo-

methylphenidate, amphetamine, dextroamphetamine, methamphetamine, phenylisopropylamine and pemoline.

9. (Amended) The method according to claim 8, wherein the CNS-stimulant drug is methylphenidate.

10. (Amended) The method according to claim 9, wherein the dosage form comprises:

(a) a longitudinally compressed tablet core containing a plurality of layers wherein methylphenidate is contained in at least one layer and at least one other layer comprises a suitable fluid-expandable polymer;

(b) a semipermeable membrane surrounding the longitudinally compressed tablet core to form a compartment having an osmotic gradient to drive fluid from an external fluid environment contacting the semipermeable membrane into the compartment; and

(c) an orifice formed through the semipermeable membrane and into the longitudinally compressed tablet core to permit methylphenidate to be released from the compartment into the external fluid environment.

11. (Amended) The method according to claim 10, wherein the longitudinally compressed tablet core comprises two layers and the methylphenidate is contained within a first layer and the fluid-expandable polymer is contained within a second layer and further wherein the orifice is formed through the semipermeable membrane adjacent to the first layer.

12. (Amended) The method according to claim 11, wherein the dosage form further comprises an outer surface having an immediate-release dose of methylphenidate applied as a coating onto the outer surface of the dosage form.

13. (Amended) The method according to claim 10, wherein the longitudinally compressed tablet core comprises three layers and a portion of the methylphenidate is contained within a first layer and the remaining portion of the methylphenidate is contained within a second layer, wherein the portion of methylphenidate contained within the first layer is less than the portion of methylphenidate contained within the second layer, and wherein the fluid-expandable polymer is contained within a third layer and the orifice is formed through the semipermeable membrane adjacent the first layer.

14. (Amended) The method according to claim 13, wherein the dosage form further comprises an outer surface having an immediate-release dose of methylphenidate applied as a coating onto the outer surface of the dosage form.

15. (Amended) A method for treating ADHD comprising administering a dosage form comprising methylphenidate that provides release of methylphenidate at an ascending release rate over an extended time period.

16. (Amended) A method comprising administering methylphenidate in a longitudinally compressed tablet dosage form that provides release of methylphenidate at an ascending release rate over an extended time period and further provides plasma methylphenidate concentrations that are substantially smoothly ascending over an extended time period.

17. (Amended) A longitudinally compressed tablet dosage form comprising a drug in a pharmaceutically acceptable carrier wherein the dosage form releases the drug from the dosage form at an ascending release rate for an extended time period following oral administration to a subject.

18. (Amended) A dosage form comprising:

(a) a longitudinally compressed tablet core containing a plurality of layers wherein a drug is contained in at least one layer and at least one other layer comprises a suitable fluid-expandable polymer;

(b) a semipermeable membrane surrounding the longitudinally compressed tablet core to form a compartment having an osmotic gradient to drive fluid from an external fluid environment contacting the semipermeable membrane into the compartment; and

(c) an orifice formed through the semipermeable membrane and into the longitudinally compressed tablet core to permit the drug to be released from within the compartment and into the external fluid environment.

19. (Amended) The dosage form according to claim 18, wherein the longitudinally compressed tablet core comprises two layers and the drug is contained within a first layer and the fluid-expandable polymer is contained within a second layer and further wherein the orifice is formed through the semipermeable membrane adjacent to the first layer.

20. (Amended) The dosage form according to claim 19, wherein the dosage form further comprises an outer surface having an immediate-release dose of a drug applied as a coating onto the outer surface of said osmotic dosage form.

21. (Amended) The dosage form according to claim 18, wherein the longitudinally compressed tablet core comprises three layers and a portion of the drug is contained within a first layer and the remaining portion of the drug is contained within a second layer, wherein the portion of drug contained within the first layer is less than the portion of drug contained within the second layer, and wherein said fluid-expandable polymer is

contained within a third layer and the orifice is formed through the semipermeable membrane adjacent to the first layer.

22. (Amended) The dosage form according to claim 21, wherein the dosage form additionally comprises an outer surface having an immediate-release dose of a drug applied as a coating onto the outer surface of the dosage form.

23. (Amended) A longitudinally compressed tablet dosage form containing a CNS-acting drug in a pharmaceutically acceptable carrier wherein the dosage form, following oral administration to a subject, releases the CNS-acting drug from the dosage form at an ascending release rate for an extended time period.

24. (Amended) The dosage form according to claim 23, wherein the CNS-acting drug is a CNS-stimulant drug selected from the group consisting of methylphenidate, d-threo-methylphenidate, amphetamine, dextroamphetamine, methamphetamine, phenylisopropylamine and pemoline.

25. (Amended) The dosage form according to claim 24, wherein the CNS-stimulant drug is methylphenidate.

26. (Amended) The dosage form according to claim 25 comprising:

(a) a longitudinally compressed tablet core containing a plurality of layers wherein methylphenidate is contained in at least one layer and at least one other layer comprises a suitable fluid-expandable polymer;

(b) a semipermeable membrane surrounding the longitudinally compressed tablet core to form a compartment having an osmotic gradient to drive fluid from an external fluid environment contacting the semipermeable membrane into the compartment; and

(c) an orifice formed through the semipermeable membrane and into the longitudinally compressed tablet core to permit methylphenidate to be released from within the compartment into the external fluid environment.

27. (Amended) The dosage form according to claim 26, wherein the longitudinally compressed tablet core comprises two layers and the methylphenidate is contained within a first layer and said fluid-expandable polymer is contained within a second layer and further wherein the orifice is formed through the semipermeable membrane adjacent the first layer.

28. (Amended) The dosage form according to claim 27, wherein the dosage form further comprises an outer surface having an immediate-release dose of methylphenidate applied as a coating onto the outer surface of the dosage form.

29. (Amended) The dosage form according to claim 26, wherein the longitudinally compressed tablet core comprises three layers and a portion of the methylphenidate is contained within a first layer and the remaining portion of the methylphenidate is contained within a second layer, wherein the portion of methylphenidate contained within first layer is less than the portion of methylphenidate contained within the second layer, and wherein the fluid-expandable polymer is contained within a third layer and the orifice is formed through the semipermeable membrane adjacent the first layer.

30. (Amended) The dosage form according to claim 29, wherein the dosage form further comprises an outer surface having an immediate-release dose of methylphenidate applied as a coating onto the outer surface of the dosage form.

31. (Amended) The dosage form according to claim 30, wherein the coating comprises an antidegradation agent.

32. (Amended) The dosage form according to claim 31, wherein the antidegradation agent is phosphoric acid.

33. (Amended) The dosage form according to claim 29, wherein the semipermeable membrane comprises cellulose acetate and a flux-enhancing agent.

34. (Amended) The dosage form according to claim 33, wherein the flux-enhancing agent is a copolymer of ethylene and propylene oxide.

check claims in amendment B

Please add claims 35-47 as follows:

35. (New) An oral dosage form comprising a drug and a pharmaceutically acceptable carrier comprising:

(a) a capsule shaped osmotically active tablet core comprising at least one drug containing layer and a push layer wherein the push layer comprises a suitable fluid expandable polymer;

(b) a semipermeable membrane surrounding the capsule shaped osmotically active tablet core to form a compartment; and

(c) an orifice formed through the semipermeable membrane and into the capsule shaped osmotically active tablet core at a location adjacent the at least one drug layer to permit the drug to be released from within the compartment into the external fluid environment in response to osmotic passage of fluid into the capsule shaped osmotically active tablet core, wherein the dosage form releases the drug at an ascending release rate for an extended time period.

36. (New) The dosage form according to claim 35, wherein the dosage form further comprises a drug layer overcoat.

37. (New) The dosage form according to claim 35, wherein the push layer further comprises at least one osmagent.

38. (New) The dosage form according to claim 35, wherein the dosage form is a bi-layer dosage form comprising one drug layer and a push layer.

39. (New) The dosage form according to claim 38, wherein the bi-layer dosage form achieves an ascending release rate for an extended time period of at least 50% of a T_{90} period.

40. (New) The dosage form according to claim 38, wherein at least about 35% of the push layer comprises the osmagent.

41. (New) The dosage form according to claim 40, wherein the osmagent is sodium chloride.

42. (New) The dosage form according to claim 38, wherein the dosage form further comprises an outer surface and an immediate-release dosage of the drug applied as a coating onto the outer surface.

43. (New) The dosage form according to claim 38, wherein the drug layer comprises methylphenidate or a pharmaceutically acceptable salt thereof.

44. (New) The dosage form according to claim 40, wherein the coating comprises an antidegradation agent.
